## IMPORTANT MANUAL INFORMATION

Particularly important information is distinguished in this manual by the following.

The Safety Alert Symbol means ATTENTION! BECOME ALERT! YOUR SAFETY IS INVOLVED!

Failure to follow WARNING instructions could result in severe injury or death to the motorcycle operator, a bystander or a person checking or repairing the motorcycle.

A CAUTION indicates special precautions that must be taken to avoid damage to the motorcycle.

**NOTE:**

A NOTE provides key information to make procedures easier or clearer.

# HOW TO USE THIS MANUAL

This manual is intended as a handy, easy-to-read reference book for the mechanic. Comprehensive explanations of all installation, removal, disassembly, assembly, repair and check procedures are laid out with the individual steps in sequential order.

- ① The manual is divided into chapters. An abbreviation and symbol in the upper right corner of each page indicate the current chapter. Refer to "SYMBOLS".
- ② Each chapter is divided into sections. The current section title is shown at the top of each page, except in Chapter 3 ("PERIODIC CHECKS AND ADJUSTMENTS"), where the sub-section title(-s) appears.
- ③ Sub-section titles appear in smaller print than the section title.
- ④ To help identify parts and clarify procedure steps, there are exploded diagrams at the start of each removal and disassembly section.
- ⑤ Numbers are given in the order of the jobs in the exploded diagram. A circled number indicates a disassembly step.
- ⑥ Symbols indicate parts to be lubricated or replaced. Refer to "SYMBOLS".
- ⑦ A job instruction chart accompanies the exploded diagram, providing the order of jobs, names of parts, notes in jobs, etc.
- ⑧ Jobs requiring more information (such as special tools and technical data) are described sequentially.

## GENERAL INFORMATION MOTORCYCLE IDENTIFICATION

EB100010

### VEHICLE IDENTIFICATION NUMBER

The vehicle identification number ① is stamped into the right side of the steering head pipe.

EB100020

### MODEL CODE

The model code label ① is affixed to the frame. This information will be needed to order spare parts.

EB102000

**IMPORTANT INFORMATION**

**PREPARATION FOR REMOVAL AND DISASSEMBLY**

1. Before removal and disassembly, remove all dirt, mud, dust, and foreign material.
2. Use only the proper tools and cleaning equipment. Refer to "SPECIAL TOOLS".
3. When disassembling, always keep mated parts together. This includes gears, cylinders, pistons and other parts that have been "mated" through normal wear. Mated parts must always be reused or replaced as an assembly.
4. During disassembly, clean all of the parts and place them in trays in the order of disassembly. This will speed up assembly and allow for the correct installation of all parts.
5. Keep all parts away from any source of fire.

EB102010

**REPLACEMENT PARTS**

Use only genuine Yamaha parts for all replacements. Use oil and grease recommended by Yamaha for all lubrication jobs. Other brands may be similar in function and appearance, but inferior in quality.

EB102020

**GASKETS, OIL SEALS AND O-RINGS**

1. When overhauling the engine, replace all gaskets, seals, and O-rings. All gasket surfaces, oil seal lips, and O-rings must be cleaned.
2. During reassembly, properly oil all mating parts and bearings and lubricate the oil seal lips with grease.

**USING A DYNAMOMETER**

The YZF-R1 has a carbon muffler that may change color when exposed to high temperatures. Therefore, when using a dynamometer always use a fan to cool the muffler.

EB102030

**LOCK WASHERS/ PLATES AND COTTER PINS**

After removal, replace all lock washers/ plates ① and cotter pins. After the bolt or nut has been tightened to specification, bend the lock washer tabs and the cotter pin ends along a flat of the bolt or nut.

EB102040

**BEARINGS AND OIL SEALS**

1. Install bearings and oil seals so that the manufacturer's marks or numbers are visible. When installing oil seals, lubricate the oil seal lips with a light coat of lithium soap base grease. Oil bearings liberally when installing, if appropriate.

① Oil seal

**CAUTION:**

**Do not spin the bearing with compressed air because this will damage the bearing surfaces.**

① Bearing

EB102050

**CIRCLIPS**

Before reassembly, check all circlips carefully and replace damaged or distorted circlips. Always replace piston pin clips after one use. When installing a circlip ①, make sure that the sharp-edged corner ② is positioned opposite the thrust ③ that the circlip receives.

④ Shaft

## CHECKING THE CONNECTIONS

Check the leads, couplers, and connectors for stains, rust, moisture, etc.

1. Disconnect:

- lead
- coupler
- connector

2. Check:

- lead
  - coupler
  - connector
- Moisture → Dry with an air blower.  
Rust/stains → Connect and disconnect several times.

3. Check:

- all connections
- Loose connection → Connect properly.

**NOTE:**

If the pin ① on the terminal is flattened, bend it up.

4. Connect:

- lead
- coupler
- connector

**NOTE:**

Make sure that all connections are tight.

5. Check:

- continuity  
(with the pocket tester)

**Pocket tester**  
**90890-03112**

**NOTE:**

- If there is no continuity, clean the terminals.
- When checking the wire harness, perform steps (1) to (3).
- As a quick remedy, use a contact revitalizer available at most part stores.

EB104000

**TIGHTENING TORQUES**

**GENERAL TIGHTENING TORQUES**

This chart specifies tightening torques for standard fasteners with a standard ISO thread pitch. Tightening torque specifications for special components or assemblies are provided for each chapter of this manual. To avoid warpage, tighten multi-fastener assemblies in a crisscross pattern and progressive stages until the specified tightening torque is reached. Unless otherwise specified, tightening torque specifications require clean, dry threads. Components should be at room temperature.

B: Thread diameter

## PERIODIC CHECKS AND ADJUSTMENTS

### INTRODUCTION

This chapter includes all information necessary to perform recommended checks and adjustments. If followed, these preventive maintenance procedures will ensure more reliable vehicle operation, a longer service life and reduce the need for costly overhaul work. This information applies to vehicles already in service as well as to new vehicles that are being prepared for sale. All service technicians should be familiar with this entire chapter.

- Out of specification → Adjust.

**Valve clearance (cold)**  
**Intake valve**  
 0.11 ~ 0.20 mm  
**Exhaust valve**  
 0.21 ~ 0.30 mm

- Turn the crankshaft clockwise.
- When piston #1 is at TDC on the compression stroke, align the TDC mark (a) on the pickup coil rotor with the crankcase mating surface (b).

**NOTE:** TDC on the compression stroke can be found when the camshaft lobes are turned away from each other.

- Measure the valve clearance with a thickness gauge (1).

**NOTE:**

- If the valve clearance is incorrect, record the measured reading.
- Measure the valve clearance in the following sequence.

**Valve clearance measuring sequence**  
**Cylinder #1 → #2 → #4 → #3**

[A] Front

- To measure the valve clearances of the other cylinders, starting with cylinder #1 at TDC, turn the crankshaft counterclockwise as specified in the following table.

- [B] Degrees that the crankshaft is turned counterclockwise
- [C] Cylinder
- [D] Combustion cycle

<b>Cylinder #2</b>	<b>180°</b>
<b>Cylinder #4</b>	<b>360°</b>
<b>Cylinder #3</b>	<b>540°</b>

- c. Round off the original valve pad number according to the following table.

Last digit	Rounded value
0 or 2	0
5	5
8	10

**EXAMPLE:**

Original valve pad number = 148 (thickness = 1.48 mm)

Rounded value = 150

- d. Locate the rounded number of the original valve pad and the measured valve clearance in the valve pad selection table. The point where the column and row intersect is the new valve pad number.

**NOTE:**

The new valve pad number is only an approximation. The valve clearance must be measured again and the above steps should be repeated if the measurement is still incorrect.

- e. Install the new valve pad ① and the valve lifter ②.

**NOTE:**

- Lubricate the valve pad with molybdenum disulfide grease.
- Lubricate the valve lifter with molybdenum disulfide oil.
- The valve lifter must turn smoothly when rotated by hand.
- Install the valve lifter and the valve pad in the correct place.

- f. Install the exhaust and intake camshafts, timing chain and camshaft caps.

	<b>Camshaft cap bolt</b> <b>10 Nm (1.0 m · kg)</b>
---	---

**NOTE:**

- Refer to "CAMSHAFTS" in chapter 4.
- Lubricate the camshaft lobes and camshaft journals.
- First, install the exhaust camshaft.
- Align the camshaft marks with the camshaft cap marks.
- Turn the crankshaft counterclockwise several full turns to seat the parts.

- g. Measure the valve clearance again.
- h. If the valve clearance is still out of specification, repeat all of the valve clearance adjustment steps until the specified clearance is obtained.

- 7. Install:

4. Install:
  - air filter element
  - air filter case cover

#### **CAUTION:**

**Never operate the engine without the air filter element installed. Unfiltered air will cause rapid wear of engine parts and may damage the engine. Operating the engine without the air filter element will also affect the carburetor tuning, leading to poor engine performance and possible overheating.**

#### **NOTE:**

When installing the air filter element into the air filter case cover, make sure that their sealing surfaces are aligned to prevent any air leaks.

### Handling notes for coolant

Coolant is potentially harmful and should be handled with special care.

### WARNING

- If coolant splashes in your eyes, thoroughly wash them with water and consult a doctor.
- If coolant splashes on your clothes, quickly wash it away with water and then with soap and water.
- If coolant is swallowed, induce vomiting and get immediate medical attention.

**CAUTION:**

- Adding water instead of coolant lowers the antifreeze content of the coolant. If water is used instead of coolant, check, and if necessary, correct the antifreeze concentration of the coolant.
- Use only distilled water. However, soft water may be used if distilled water is not available.
- If coolant comes into contact with painted surfaces, immediately wash them with water.
- Do not mix different types of anti-freeze.

- Tighten the locknut ① to specification.

	<b>Locknut</b> 16 Nm (1.6 m • kg)
--	--------------------------------------

**⚠ WARNING**

A soft or spongy feeling in the brake pedal can indicate the presence of air in the brake system. Before the vehicle is operated, the air must be removed by bleeding the brake system. Air in the brake system will considerably reduce braking performance and could result in loss of control and possibly an accident. Therefore, check and, if necessary, bleed the brake system.

**CAUTION:**

After adjusting the brake pedal position, make sure that there is no brake drag.

### 3. Adjust:

- rear brake light switch
- Refer to “ADJUSTING THE REAR BRAKE LIGHT SWITCH”.

EB304020

## CHECKING THE BRAKE FLUID LEVEL

1. Stand the motorcycle on a level surface.

**NOTE:** \_\_\_\_\_

- Place the motorcycle on a suitable stand.
- Make sure that the motorcycle is upright.

2. Check:

- brake fluid level  
Below the minimum level mark (a) → Add the recommended brake fluid to the proper level.

- A Front brake
- B Rear brake

**⚠ WARNING** \_\_\_\_\_

- Use only the designated brake fluid. Other brake fluids may cause the rubber seals to deteriorate, causing leakage and poor brake performance.
- Refill with the same type of brake fluid that is already in the system. Mixing brake fluids may result in a harmful chemical reaction, leading to poor brake performance.
- When refilling, be careful that water does not enter the brake fluid reservoir. Water will significantly lower the boiling point of the brake fluid and could cause vapor lock.

**CAUTION:** \_\_\_\_\_

Brake fluid may damage painted surfaces and plastic parts. Therefore, always clean up any spilt brake fluid immediately.

**NOTE:** \_\_\_\_\_

In order to ensure a correct reading of the brake fluid level, make sure that the top of the brake fluid reservoir is horizontal.

## CHECKING THE BRAKE HOSES/ BLEEDING THE HYDRAULIC BRAKE SYSTEM

EB304062

### CHECKING THE BRAKE HOSES

The following procedure applies to all of the brake hoses and brake hose clamps.

1. Check:
  - brake hose ①  
Cracks/damage/wear → Replace.
2. Check:
  - brake hose clamp  
Loose → Tighten the clamp bolt.
3. Hold the motorcycle upright and apply the brake several times.
4. Check:
  - brake hose  
Brake fluid leakage → Replace the damaged hose.  
Refer to "FRONT AND REAR BRAKES" in chapter 7.

EB304072

### BLEEDING THE HYDRAULIC BRAKE SYSTEM

#### **⚠ WARNING**

**Bleed the hydraulic brake system whenever:**

- the brake system was disassembled,
- a brake hose was loosened, disconnected or replaced,
- the brake fluid level is very low,
- brake operation is faulty.

#### **NOTE:**

- Be careful not to spill any brake fluid or allow the brake fluid reservoir to overflow.
- When bleeding the hydraulic brake system, make sure that there is always enough brake fluid before applying the brake. Ignoring this precaution could allow air to enter the hydraulic brake system, considerably lengthening the bleeding procedure.
- If bleeding is difficult, it may be necessary to let the brake fluid settle for a few hours. Repeat the bleeding procedure when the tiny bubbles in the hose have disappeared.

# BLEEDING THE HYDRAULIC BRAKE SYSTEM

## 5. Bleed:

- hydraulic brake system

- Fill the brake fluid reservoir to the proper level with the recommended brake fluid.
- Install the brake fluid reservoir diaphragm.
- Connect a clear plastic hose (1) tightly to the bleed screw (2).
  - [A] Front brake
  - [B] Rear brake
- Place the other end of the hose into a container.
- Slowly apply the brake several times.
- Fully squeeze the brake lever or fully depress the brake pedal and hold it in position.
- Loosen the bleed screw.

### NOTE:

Loosening the bleed screw will release the pressure and cause the brake lever to contact the throttle grip or the brake pedal to fully extend.

- Tighten the bleed screw and then release the brake lever or brake pedal.
- Repeat steps (e) to (h) until all of the air bubbles have disappeared from the brake fluid in the plastic hose.
- Tighten the bleed screw to specification.

	<b>Bleed screw</b> <b>6 Nm (0.6 m · kg)</b>

- Fill the brake fluid reservoir to the proper level with the recommended brake fluid.  
Refer to "CHECKING THE BRAKE FLUID LEVEL".

### **⚠ WARNING**

**After bleeding the hydraulic brake system, check the brake operation.**

# ADJUSTING THE SHIFT PEDAL/ ADJUSTING THE DRIVE CHAIN SLACK

EB304081

## ADJUSTING THE SHIFT PEDAL

### NOTE:

The shift pedal position is determined by the installed shift rod length ①.

### 1. Measure:

Direction ④	Installed shift rod length decreases.

- Tighten both locknuts.
- Make sure that the installed shift rod length is within specification.

EB304092

## ADJUSTING THE DRIVE CHAIN SLACK

### NOTE:

The drive chain slack must be checked at the tightest point on the chain.

### CAUTION:

A drive chain that is too tight will overload the engine and other vital parts, and one that is too loose can skip and damage the swingarm or cause an accident. Therefore, keep the drive chain slack within the specified limits.

- Stand the motorcycle on a level surface.

### ⚠ WARNING

Securely support the motorcycle so that there is no danger of it falling over.

### NOTE:

Place the motorcycle on a suitable stand so that the rear wheel is elevated.

EB304100

## LUBRICATING THE DRIVE CHAIN

The drive chain consists of many interacting parts. If the drive chain is not maintained properly, it will wear out rapidly. Therefore, the drive chain should be serviced, especially when the motorcycle is used in dusty areas. This motorcycle has a drive chain with small rubber O-rings between each side plate. Steam cleaning, high-pressure washing, certain solvents, and the use of a coarse brush can damage these O-rings. Therefore, use only kerosine to clean the drive chain. Wipe the drive chain dry and thoroughly lubricate it with engine oil or chain lubricant that is suitable for O-ring chains. Do not use any other lubricants on the drive chain since they may contain solvents that could damage the O-rings.

EB304130

## CHECKING AND ADJUSTING THE STEERING HEAD

1. Stand the motorcycle on a level surface.

### **⚠ WARNING**

**Securely support the motorcycle so that there is no danger of it falling over.**

**NOTE:**

Make sure that all of the cables and wires are properly routed.

- a. Point the front wheel straight ahead.
- b. Install a plastic locking tie (1) loosely around the end of the handlebar as shown.
- c. Hook a spring gauge (2) onto the plastic locking tie.

# CHECKING AND ADJUSTING THE STEERING HEAD/ CHECKING THE FRONT FORK

## CHECKING THE TIRES

The following procedure applies to both of the tires.

### 1. Measure:

- tire pressure  
Out of specification → Regulate.

### **⚠ WARNING**

- The tire pressure should only be checked and regulated when the tire temperature equals the ambient air temperature.
- The tire pressure and the suspension must be adjusted according to the total weight (including cargo, rider, passenger and accessories) and the anticipated riding speed.
- Operation of an overloaded motorcycle could cause tire damage, an accident or an injury.

### ⚠ WARNING

- Do not use a tubeless tire on a wheel designed only for tube tires to avoid tire failure and personal injury from sudden deflation.
- When using a tube tire, be sure to install the correct tube.
- Always replace a new tube tire and a new tube as a set.
- To avoid pinching the tube, make sure that the wheel rim band and tube are centered in the wheel groove.
- Patching a punctured tube is not recommended. If it is absolutely necessary to do so, use great care and replace the tube as soon as possible with a good quality replacement.

**ELECTRICAL SYSTEM****CHECKING AND CHARGING THE BATTERY****⚠ WARNING**

Batteries generate explosive hydrogen gas and contain electrolyte which is made of poisonous and highly caustic sulfuric acid.

Therefore, always follow these preventive measures:

- Wear protective eye gear when handling or working near batteries.
- Charge batteries in a well-ventilated area.
- Keep batteries away from fire, sparks or open flames (e.g., welding equipment, lighted cigarettes).
- DO NOT SMOKE when charging or handling batteries.
- KEEP BATTERIES AND ELECTROLYTE OUT OF REACH OF CHILDREN.
- Avoid bodily contact with electrolyte as it can cause severe burns or permanent eye injury.

**FIRST AID IN CASE OF BODILY CONTACT:****EXTERNAL**

- Skin – Wash with water.
- Eyes – Flush with water for 15 minutes and get immediate medical attention.

**INTERNAL**

- Drink large quantities of water or milk followed with milk of magnesia, beaten egg or vegetable oil. Get immediate medical attention.

**CAUTION:**

- This is a sealed battery. Never remove the sealing caps because the balance between cells will not be maintained and battery performance will deteriorate.
- Charging time, charging amperage and charging voltage for an MF battery are different from those of conventional batteries. The MF battery should be charged as explained in the charging method illustrations. If the battery is overcharged, the electrolyte level will drop considerably. Therefore, take special care when charging the battery.

**NOTE:**

Since MF batteries are sealed, it is not possible to check the charge state of the battery by measuring the specific gravity of the electrolyte. Therefore, the charge of the battery has to be checked by measuring the voltage at the battery terminals.

1. Remove:
  - rider seat  
Refer to "SEATS".
2. Disconnect:
  - battery leads  
(from the battery terminals)

**CAUTION:**

**First, disconnect the negative lead ①, then the positive lead ②.**

3. Remove:
  - battery
4. Measure:
  - battery charge
  - a. Connect a digital voltmeter to the battery terminals.

**Tester positive probe → battery positive terminal**  
**Tester negative probe → battery negative terminal**

**NOTE:**

- The charge state of an MF battery can be checked by measuring its open-circuit voltage (i.e., the voltage when the positive terminal is disconnected).
- No charging is necessary when the open-circuit voltage equals or exceeds 12.8 V.

b. Check the charge of the battery, as shown in the charts and the following example.

**Example**

Open-circuit voltage = 12.0 V

Charging time = 6.5 hours

Charge of the battery = 20 ~ 30%

## 5. Charge:

- battery (refer to the appropriate charging method illustration)

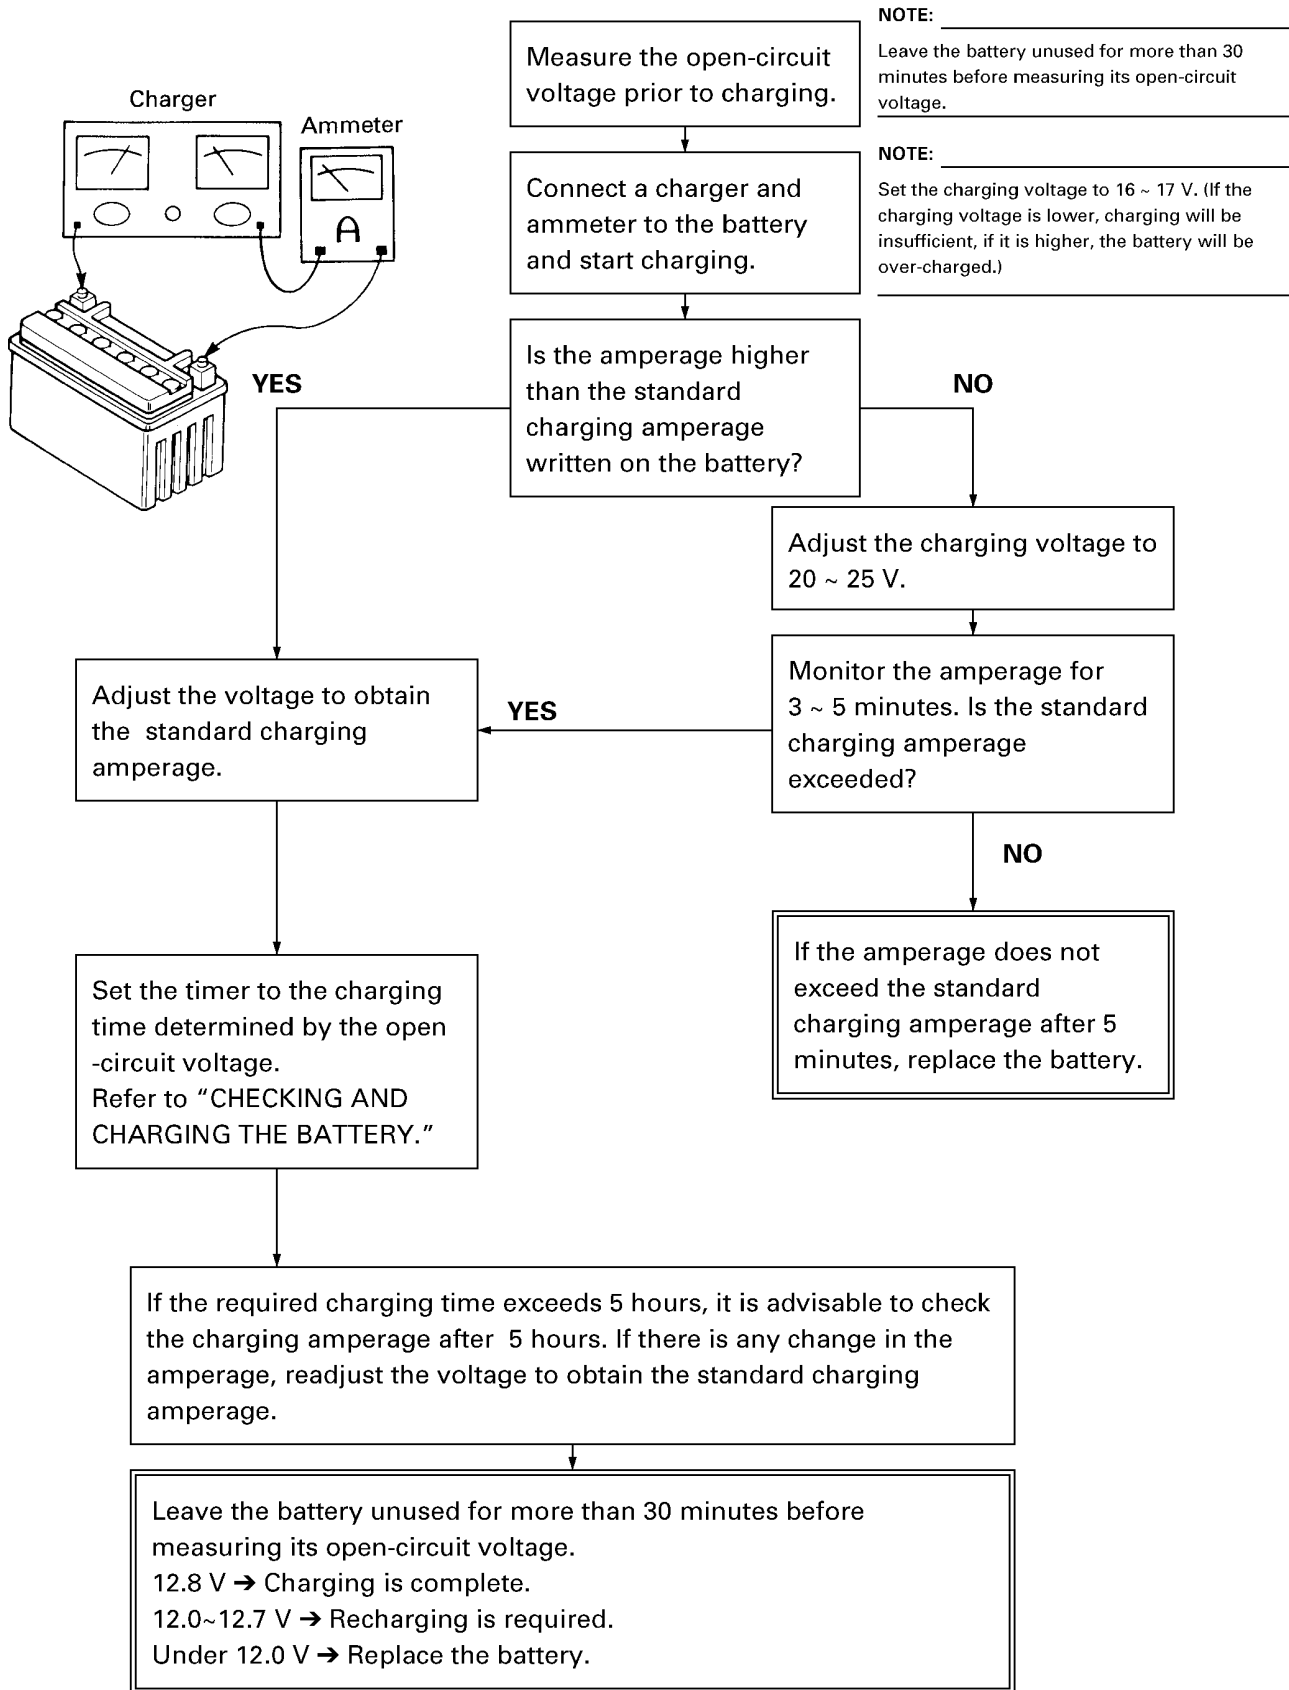

### ⚠ WARNING

**Do not quick charge a battery.**

### CAUTION:

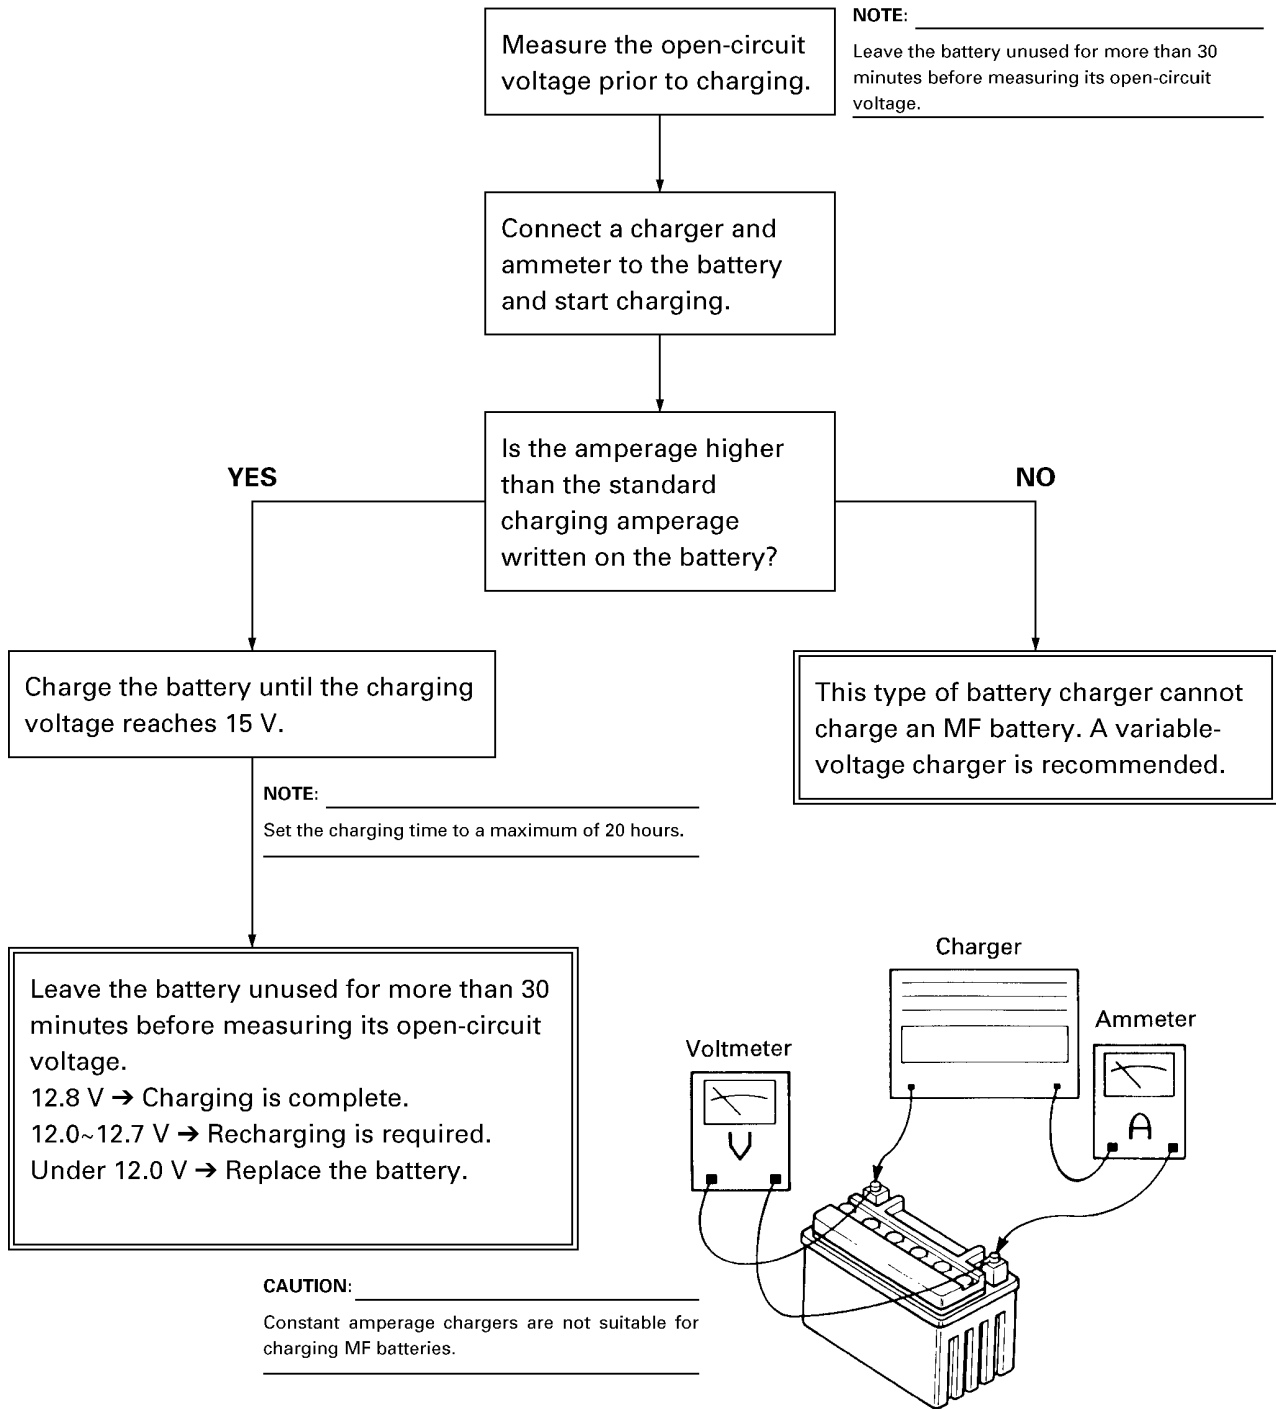

- Never remove the MF battery sealing caps.
- Do not use a high-rate battery charger since it forces a high-amperage current into the battery quickly and can cause battery overheating and battery plate damage.
- If it is impossible to regulate the charging current on the battery charger, be careful not to overcharge the battery.
- When charging a battery, be sure to remove it from the motorcycle. (If charging has to be done with the battery mounted on the motorcycle, disconnect the negative lead from the battery terminal.)
- To reduce the chance of sparks, do not plug in the battery charger until the battery charger leads are connected to the battery.
- Before removing the battery charger lead clips from the battery terminals, be sure to turn off the battery charger.
- Make sure that the battery charger lead clips are in full contact with the battery terminal and that they are not shorted. A corroded battery charger lead clip may generate heat in the contact area and a weak clip spring may cause sparks.
- If the battery becomes hot to the touch at any time during the charging process, disconnect the battery charger and let the battery cool before reconnecting it. Hot batteries can explode!
- As shown in the following illustration, the open-circuit voltage of an MF battery stabilizes about 30 minutes after charging has been completed. Therefore, wait 30 minutes after charging is completed before measuring the open-circuit voltage.

Out of specification → Replace the crankshaft journal bearings.

**Crankshaft-journal-to-crankshaft-journal-bearing clearance**  
**0.004 ~ 0.028 mm**

### CAUTION:

Do not interchange the crankshaft journal bearings. To obtain the correct crankshaft-journal-to-crankshaft-journal-bearing clearance and prevent engine damage, the crankshaft journal bearings must be installed in their original positions.

- a. Clean the crankshaft journal bearings, crankshaft journals, and bearing portions of the crankcase.
- b. Place the upper crankcase upside down on a bench.
- c. Install the crankshaft journal upper bearings ① and the crankshaft into the upper crankcase.

**NOTE:** Align the projections ③ on the crankshaft journal upper bearings with the notches ④ in the upper crankcase.

- d. Put a piece of Plastigauge® ② on each crankshaft journal.

- e. Install the crankshaft journal lower bearings into the lower crankcase and assemble the crankcase.

**NOTE:** Align the projections ③ on the crankshaft journal lower bearings with the notches ④ in the lower crankcase.  
Do not move the crankshaft until the clearance measurement has been completed.

- f. Tighten the bolts to specification in the tightening sequence cast on the crankcase.

- Bolt ① ~ ⑩**  
**32 Nm (3.2 m • kg)**
- Bolt ⑪ ~ ⑮, ⑰ ~ ⑳, ㉓, ㉕ ~ ㉘**

If the clearance is out of specification, select replacement crankshaft journal bearings.

- 2. Select:
  - crankshaft journal bearings (J<sub>1</sub> ~ J<sub>5</sub>)

**NOTE:**

- The numbers stamped into the crankshaft web and the numbers stamped into the lower crankcase are used to determine the replacement crankshaft journal bearing sizes.
- “J<sub>1</sub>” ~ “J<sub>5</sub>” refer to the bearings shown in the crankshaft illustration.
- If “J<sub>1</sub>” ~ “J<sub>5</sub>” are the same, use the same size for all of the bearings.

For example, if the crankcase “J<sub>1</sub>” and crankshaft web “J<sub>1</sub>” numbers are “6” and “2” respectively, then the bearing size for “J<sub>1</sub>” is:

**Bearing size for J<sub>1</sub>:**  
 “J<sub>1</sub>” (crankcase) – “J<sub>1</sub>” (crankshaft web) – 2 =  
 6 – 2 – 2 = 2

## HANDLING THE REAR SHOCK ABSORBER AND GAS CYLINDER

### **⚠ WARNING**

This rear shock absorber and gas cylinder contain highly compressed nitrogen gas. Before handling the rear shock absorber or gas cylinder, read and make sure you understand the following information. The manufacturer cannot be held responsible for property damage or personal injury that may result from improper handling of the rear shock absorber and gas cylinder.

- Do not tamper or attempt to open the rear shock absorber or gas cylinder.
- Do not subject the rear shock absorber or gas cylinder to an open flame or any other source of high heat. High heat can cause an explosion due to excessive gas pressure.
- Do not deform or damage the rear shock absorber or gas cylinder in any way. If the rear shock absorber, gas cylinder or both are damaged, damping performance will suffer.

EB706111

## DISPOSING OF A REAR SHOCK ABSORBER AND GAS CYLINDER

Gas pressure must be released before disposing of a rear shock absorber and gas cylinder. To release the gas pressure, press on the gas valve needle with a suitable tool as shown, until all of the gas is released (the hissing has stopped).

### **⚠ WARNING**

Wear eye protection to prevent eye damage from released gas or metal chips.

INSTRUMENT FUNCTIONS

INDICATOR LIGHTS

- ① Neutral indicator light “ N ”
- ② High beam indicator light “ ≡O ”
- ③ Turn indicator light “ ◁▷ ”
- ④ Fuel indicator light “ ⛽ ”

**Turn indicator light “ ◁▷ ”**

This indicator flashes when the turn switch is moved to the left or right.

**Neutral indicator light “ N ”**

This indicator comes on when the transmission is in neutral.

**High beam indicator light “ ≡O ”**

This indicator comes on when the headlight high beam is used.

**Fuel indicator light “ ⛽ ”**

When the fuel level drops below approximately 5.5 L, this light will come on. When this light comes on, fill the fuel tank at the first opportunity.

OIL LEVEL/COOLANT TEMPERATURE WARNING LIGHT

- ① Oil level/coolant temperature warning light “ ⚠ ”
- ② Oil level symbol “ ⛽ ”
- ③ Coolant temperature symbol “ ℹ ”

This warning light has two functions.

- The light will come on and symbol “ ⛽ ” will flash if the engine oil level is low. If this symbol flashes, stop the engine immediately and fill it with oil to the specified level.
- The light will come on and symbol “ ℹ ” will flash if the coolant temperature is too high. The following chart shows the conditions of the indicator light, symbol and temperature display in accordance with the coolant temperature.

**CAUTION:**

- **Do not run the motorcycle until you know it has sufficient engine oil.**
- **Do not run the motorcycle if the engine is overheated.**

**NOTE:**

Even if the oil is filled to the specified level, the warning light may flicker when riding on a slope or during sudden acceleration or deceleration, but this is normal.

Coolant temperature	Display	Conditions	What to do
0 °C ~ 40 °C	 10 °C 	Symbol is on and “LO” is displayed.	Go ahead with riding.
41 °C ~ 117 °C	 90 °C 	Symbol is on and temperature is displayed.	Go ahead with riding.
118 °C ~ 140 °C	 130 °C 	Symbol and temperature flashes and indicator light comes on.	Stop the motorcycle and allow it to idle until the coolant temperature goes down. If the temperature does not go down, stop the engine. Refer to “OVERHEATING” in chapter 9.
141 °C ~	 HI °C 	Symbol flashes, “HI” is displayed and flashes, and the indicator light comes on.	Stop the engine and allow it to cool. Refer to “OVERHEATING” in chapter 9.

### COMBINATION METER

- ① Speedometer
- ② Clock, odometer
- ③ “SELECT” button
- ④ “RESET” button

This combination meter is equipped with the following.

- A speedometer
- An odometer
- Two trip odometers
- A fuel reserve tripmeter
- A clock

For GB and USA models only:

To change the speedometer display from kilometers to miles, press the “SELECT” button for at least two seconds.

#### Odometer and trip meters

Use the trip meters to estimate how far you can ride on a tank of fuel.

Use the fuel reserve trip meter to see the distance traveled from when the fuel level dropped to the reserve level.

Push the “SELECT” button to change between the odometer mode “ODO” and the trip odometer modes “TRIP 1” and “TRIP 2” in the following order:

“ODO” → “TRIP 1” → “TRIP 2” → “ODO”

When the fuel level indicator light comes on the odometer display will automatically change to the fuel reserve trip meter mode “TRIP F” and start counting the distance traveled from that point. Push the “SELECT” button to change between the fuel odometer, trip odometer and odometer modes in the following order:

“TRIP F” → “TRIP 1” → “TRIP 2” → “ODO”  
→ “TRIP F”

To reset a trip odometer to 0.0, select it by pushing the “SELECT” button and push the “RESET” button for at least one second. To reset the fuel reserve trip meter, select it by pushing the “SELECT” button and push the “RESET” button for at least one second. The display will return to “TRIP 1”. If you do not reset the fuel reserve trip meter manually, it will automatically reset and return to “TRIP 1” after refueling and the motorcycle has traveled both 5 km and for approximately 3 minutes.

### **Clock**

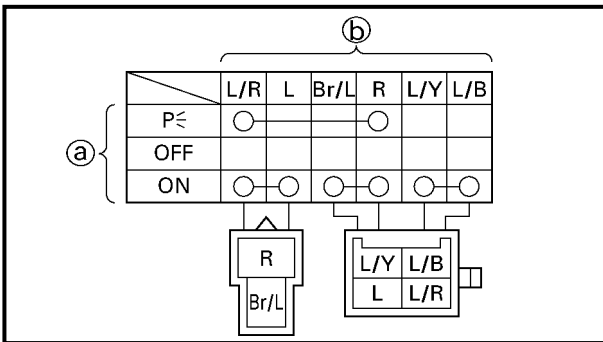

To change the display to the clock mode, push both the “SELECT” and “RESET” buttons.

To set the clock:

1. Push both the “SELECT” and “RESET” buttons for at least two seconds.
2. When the hour digits start flashing, push the “RESET” button to set the hours.
3. Push the “SELECT” button to change the minutes.
4. When the minute digits start flashing, push the “RESET” button to set the minutes.
5. Push the “SELECT” button to start the clock.

### **NOTE:**

After setting the clock, be sure to push the “SELECT” button before turning the main switch to “OFF”, otherwise the clock will not be set.

## SWITCHES

### CHECKING SWITCH CONTINUITY

Check each switch for continuity with the pocket tester. If the continuity reading is incorrect, check the wiring connections and if necessary, replace the switch.

#### CAUTION:

Never insert the tester probes into the coupler terminal slots ①. Always insert the probes from the opposite end of the coupler, taking care not to loosen or damage the leads.

Pocket tester  
90890-03112

#### NOTE:

- Before checking for continuity, set the pocket tester to "0" and to the "Ω × 1" range.
- When checking for continuity, switch back and forth between the switch positions a few times.

The terminal connections for switches (e.g., main switch, engine stop switch) are shown in an illustration similar to the one on the left.

The switch positions ① are shown in the far left column and the switch lead colors ② are shown in the top row in the switch illustration.

#### NOTE:

"○—○" indicates a continuity of electricity between switch terminals (i.e., a closed circuit at the respective switch position).

The example illustration on the left shows that:

There is continuity between blue/red and red when the switch is set to "P $\leq$ ". There is continuity between blue/red and blue, between brown/blue and red, and between blue/yellow and blue/black when the switch is set to "ON".

EB803010

**STARTING CIRCUIT CUTOFF SYSTEM OPERATION**

If the engine stop switch is set to “○” and the main switch is set to “ON” (both switches are closed), the starter motor can only operate if at least one of the following conditions is met:

- The transmission is in neutral (the neutral switch is closed).
- The clutch lever is pulled to the handlebar (the clutch switch is closed) and the sidestand is up (the sidestand switch is closed).

The starting circuit cutoff relay prevents the starter motor from operating when neither of these conditions has been met. In this instance, the starting circuit cutoff relay is open so current cannot reach the starter motor. When at least one of the above conditions has been met the starting circuit cutoff relay is closed and the engine can be started by pressing the start switch.
